

<pre> [...] contract <A> { [...] function <f>(<parameters>) [...] returns (<T>) { <T> <v>; <P> return <v>; } [...] } [...]</pre>	=	<pre> [...] contract <A> { [...] function <f>(<parameters>) [...] returns (<T> <v>) { <P> } [...] } [...]</pre>
--	---	---

where f and v are identifiers, T is a type, P is a Solidity command, $parameters$ is a list of identifiers, and $[...]$ denotes Solidity constructs;

provided v is assigned on every execution path of P that reaches the end of the body, and P contains no **return** statement other than the final one.

Rule 0.31: Use named return variables.
