
Rule 0.4 Make Constructor payable.

<pre>[...] contract <A> { [...] constructor(<parameters>) [...] { <P> } [...] } [...]</pre>	$=$	<pre>[...] contract <A> { [...] constructor(<parameters>) payable [...] { <P> } [...] } [...]</pre>
---	-----	---

where A is an identifier, P is a Solidity command, $parameters$ is a list of identifiers, and $[...]$ denotes Solidity constructs;

provided no deployment of A attaches Ether; that is, the amount of Ether sent on every creation of **new** A is zero and the transaction that deploys A also carries zero call value.
