
Rule 0.5 Use named return variables.

<pre>[...] contract <A> { [...] function <f>(<parameters>) [...] returns (<T>) { <T> <v>; <P> return <v>; } [...] }</pre>	=	<pre>[...] contract <A> { [...] function <f>(<parameters>) [...] returns (<T> <v>) { <P> } [...] }</pre>
--	---	---

where A , f and v are identifiers, T is a type, P is a Solidity command, $parameters$ is a list of identifiers, and [...] denotes Solidity constructs;

provided v does not occur in $\langle parameters \rangle$ nor as a declaration inside P ; and every **return** statement occurring in P carries an explicit expression.
